## DSL

connectivity Mooncomputers offers a full range of data services. We only offer the highest quality business grade services at a cost effective price, ensuring that our business clients retain a competitive advantage. As a wholesaler of business grade DSL

### Broadband options

IP Stream ADSL (up to 8mbit download and 832k upload)  
IP Stream ADSL2 (up to 24mbit download and 1.3mbit upload)  
IP Stream SDSL (up to 2mbit download and upload)  
LLU ADSL (up to 8mbit download and 832k upload)  
LLU ADSL2 (up to 24mbit download and 2.5mbit upload)  
BT 21CN (up to 24mbit download and 2.5mbit upload)  
LLU SDSL (up to 2mbit download and upload with contention as low as 1:1)  
Bonded Broadband (bonding multiple circuits to create a larger physical connection)  
Specialist broadband  
Load Balanced DSL  
Bonded DSL  
Fibre Connections  
Leased Lines  
Ethernet  
Partner packages  
Reseller broadband  
L2TP

### 21CN

As part of our dedication to being at the forefront of technology Mooncomputers offer our customers access to the BT 21CN network where coverage allows. BT21CN is the latest generation of BT's network. The goal has been to create an IP based national fibre network to enable communication in a range of formats and support the demands for voice and data convergence. This has allowed for the provision of faster and more stable broadband at ADSL2 speeds through the BT network.

### ADSL2

ADSL2 is the next generation of broadband. The mooncomputers has been at the forefront of bringing and developing this technology within the channel. As more business services are reliant upon bandwidth the capability and quality of the internet connection is paramount

### SDSL

Traditional ADSL provides a much higher download than upload capability. SDSL is designed to match the available bandwidth in both directions, with speeds ranging from 512k to 2mbit. SDSL is intended for us as a business alternative to a lower bandwidth leased line. Although ADSL2 is a direct alternative SDSL is still a useful product to guarantee the service levels that a customer will receive and maximise the performance of distributed network applications.
